

# Mayavi2 tutorial

Prabhu Ramachandran and Gaël Varoquaux

# **1** Introduction to Mlab

# **1** Introduction to Mlab

# 1 Mlab: simple scripting for Mayavi2

```
from enthought.mayavi import mlab
```

- Simple problems should have simple solutions.
- Work interactively in IPython (`-wthread`).
- Work with `numpy` arrays.
- People know the `pylab/matlab` plotting API.

```
x, y = ogrid[-10:10:100j, -10:10:100j]  
r = sqrt(x**2 + y**2)  
from enthought.mayavi import mlab  
mlab.surf(sin(r)/r)
```

x

# 1 Mlab: plotting functions

## 0D data

`mlab.points3d(x, y, z)`

## 1D data

`mlab.plot3d(x, y, z)`

## 2D data

`mlab.surf(z)`

`mlab.mesh(x, y, z)`

## 3D data

`mlab.contour3d(z)`

## Vector fields

`mlab.quiver3d(x, y, z)`

# 1 Mlab: plotting functions (remarks)

- List of plotting functions in user guide.
- Every plotting function has a test/demo function.
- `mlab.surf` vs. `mlab.mesh`:
  - `mlab.surf` = carpet plot:  
image-like data + elevation

- `mlab.mesh` = orthogonal-grid,  
but general shape

# 1 Mlab: sprucing up the plot

```
mlab.title('A title')  
mlab.colorbar()
```

+ axes, outlines, text, ...

- Many keyword arguments for plotting functions.

A title

## Gotcha: extents

In VTK the extents are given by the data extents.

```
x, y = mgrid[-10:10:100j, -10:10:100j]  
r = sqrt(x**2 + y**2)  
s = mlab.mesh(x, y, sin(r)/r, extent  
              =(0,1, 0,1, 0,1))  
mlab.outline(s, extent=(0,1, 0,1, 0,1))  
mlab.axes(s, extent=(0,1, 0,1, 0,1))
```

# 1 Mlab: managing figures

## Figures

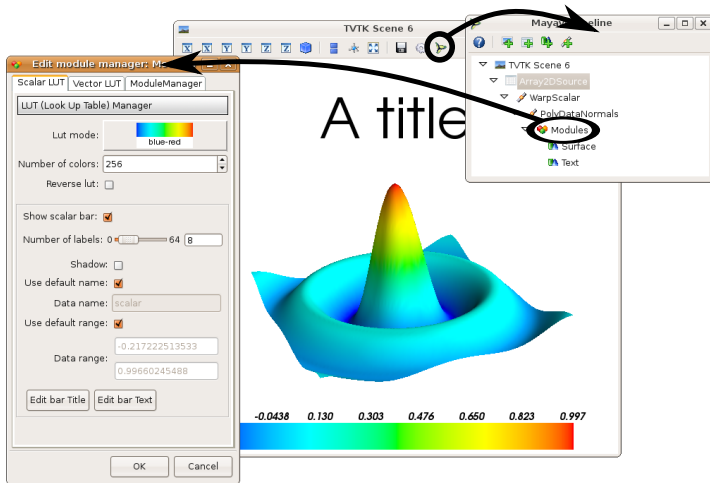

- `mlab.figure()`: create a new figure or retrieve an existing figure.
- `mlab.clf()`: clear the current figure.
- `mlab.gcf()`: return the current figure.

## show and the event loop

- GUI event loop needs to be running:  
`mlab.show()` to display the visualization (after creating it).
- `@mlab.show`: decorator to make sure a function runs in the event loop.

# 1 Mlab: Interacting graphically

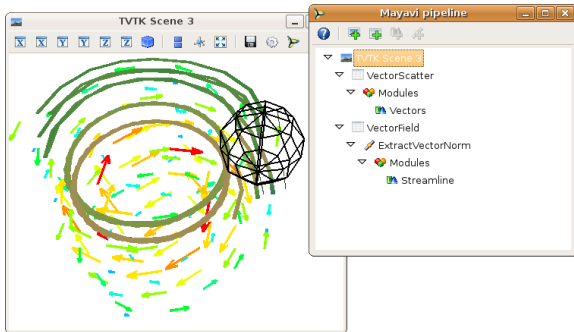

```
mlab.show_pipeline()
```

# 1 Mlab: the pipeline

```
x, y, z = mgrid[-2:3, -2:3, -2:3]
r = sqrt(x**2 + y**2 + z**4)
mlab.quiver3d(y*sin(r)/r, -x*sin(r)/r, zeros_like(z))
mlab.flow(y*sin(r)/r, -x*sin(r)/r, zeros_like(z),
          colormap='gist_earth', linetype='ribbon')
```

x

We visualize the same data with two different methods:

**Visualizations = data sources + visualization modules**

# 1 Mlab: a more complex pipeline

30 000 points

## Complete pipeline

# 1 Mlab: creating the pipeline

## Adding a cut plane

```
x, y, z = ogrid[-5:5:100j, -5:5:100j, -5:5:100j]
scalars = x*x*0.5 + y*y + z*z*2.0
obj = mlab.contour3d(scalars)
```

x

# 1 Mlab: creating the pipeline

## Adding a cut plane

## `mlab.pipeline` object

```
x, y, z = ogrid[-5:5:100j, -5:5:100j, -5:5:100j]
```

```
scalars = x*x*0.5 + y*y + z*z*2.0
```

```
obj = mlab.contour3d(scalars, opacity=0.5)
```

```
mlab.pipeline.scalar_cut_plane(obj)
```

x

# 1 Mlab and Mayavi2

- `mlab.options.backend = 'envisage'`
  - ⇒ mlab commands open up a full blown mayavi application.
- By default, mlab uses a full blown application if open.
  - ⇒ Use in interactive shell and `mayavi2 -x foo.py`
